Buying the Transmitter: For many hobbyists and even modelers, there are many items and accessories that come along with using a model rocket. Here are a few things to consider when buying a Rocket Jack Pro or any other model rocket transmitter. Price: After you have bought your model rocket and are in the final stages of assembly, the price of the Rocket Jack Pro will be the last thing you will be thinking about. When I bought mine, I paid around \$100.00. If you are buying it second hand, the price is probably higher. Size: It is important to remember that the transmitter has to be within 3 to 4 inches of the rocket. After you have bought the transmitter, it is a good idea to make sure that your launcher can be launched at least twice to make sure the transmitter will fit. Also make sure you know how much of the rocket you can stick into the launcher before it is too late. Weight: The weight of the rocket will play a major role in launching it, so make sure you are aware of the weight before you start to assemble the rocket. It is also important to remember that the weight of the rocket affects how much thrust it receives. To be honest, this isn't something I have thought much about, but it is definitely something you will have to remember when you start to assemble your rocket. Quality: Quality is very important when buying a transmitter and you should always take care when purchasing a transmitter. The receiver should be strong enough to fit into a rocket. I had to do some searching for a new receiver for my rocket, but I found a number of them. I just didn't want to buy a transmitter that was not high quality. Here is a link to the website that I bought my transmitter from. Anything else you wish to add? The long-term goal of this project is to develop an understanding of the basic mechanism of the rapid-eye-movement (REM) sleep behavioral state. Experiments are being conducted on unanesthetized, unrestrained cats to identify and characterize features of the ongoing neural activity of the brain during REM sleep. Concurrently, an investigation is being made of the behavioral correlates of this physiological state. The electrophysiological recording of REM sleep is being supplemented by quantitative behavioral analysis and 82157476af
